Geses, Reynalyn C.   BSIT 3D

Based on my experience, I am a student using GitHub. Git and GitHub are very essential in team collaborations since they have the version control and central repository. Git has made it easier for teams to handle several project versions, follow the changes and revert back to the earlier version of the projects. Team members can easily retrieve, update and merge work through GitHub. Features such as openness and better collaboration include pull requests and code reviews. Scheduling of tasks and tracking of how much has been done is made easy with the help of keeping track of problems and practicing project management. Branching is great for experimenting without harming the final product. GitHub is an open contribution platform that makes learning, developing, and mastery of the tools in practice software development.
